MASSCON · KOREA

Three formats, one platform.

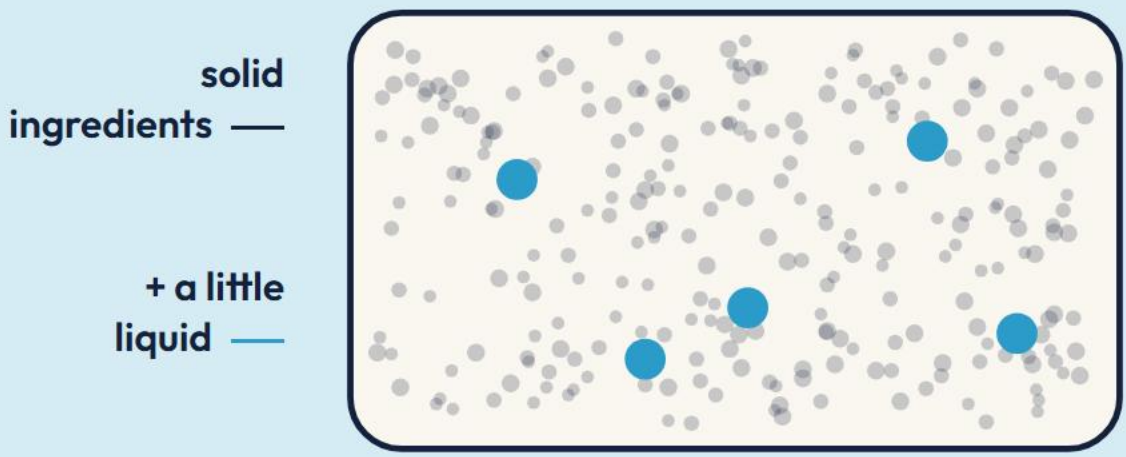

Solid odor care for the bathroom, shoes and car.

THE USUAL WAY

A solid isn't just a solid.

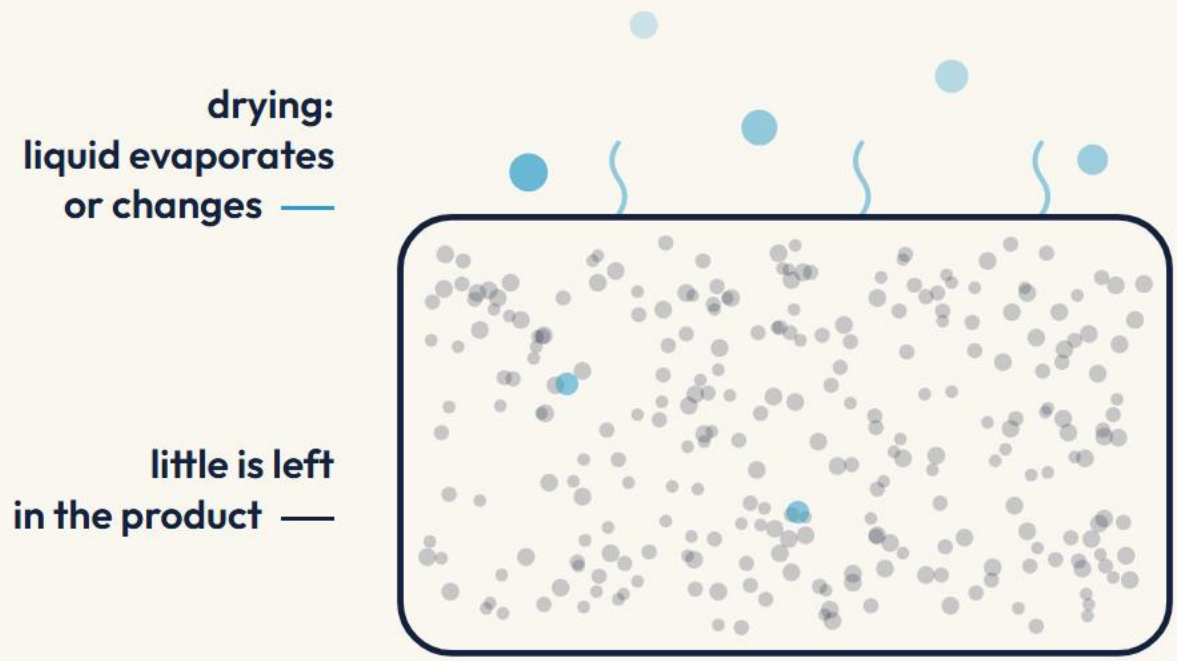

Most solid products, like shampoo bars or solid perfumes, are made of solid ingredients alone, or of liquids mixed into solids, then shaped and dried.

THE PROBLEM

Drying is where the liquid is lost.

Only a little liquid can be mixed in. Then drying makes much of it evaporate or change. So the active oils that do the work are weak in the final product, and people go back to liquids.

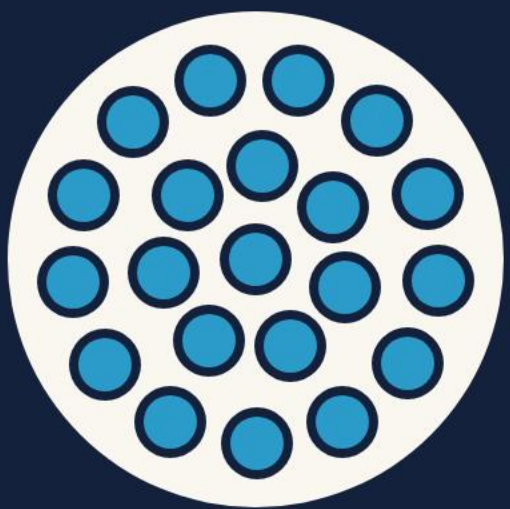

THE MASSCON WAY

We keep the active liquid in the solid, unchanged.

15×

more liquid kept in the finished product than conventional solids

active liquid in every pore

Our patented porous carrier holds oil- or water-based ingredients as they are: not dried off or altered. Then it releases them where they're needed.

BATHROOM · TOFUME

It starts in the water.

Released by fizzing: a heart tablet sinks, fizzes, and an essential oil film keeps odor down in the bowl.

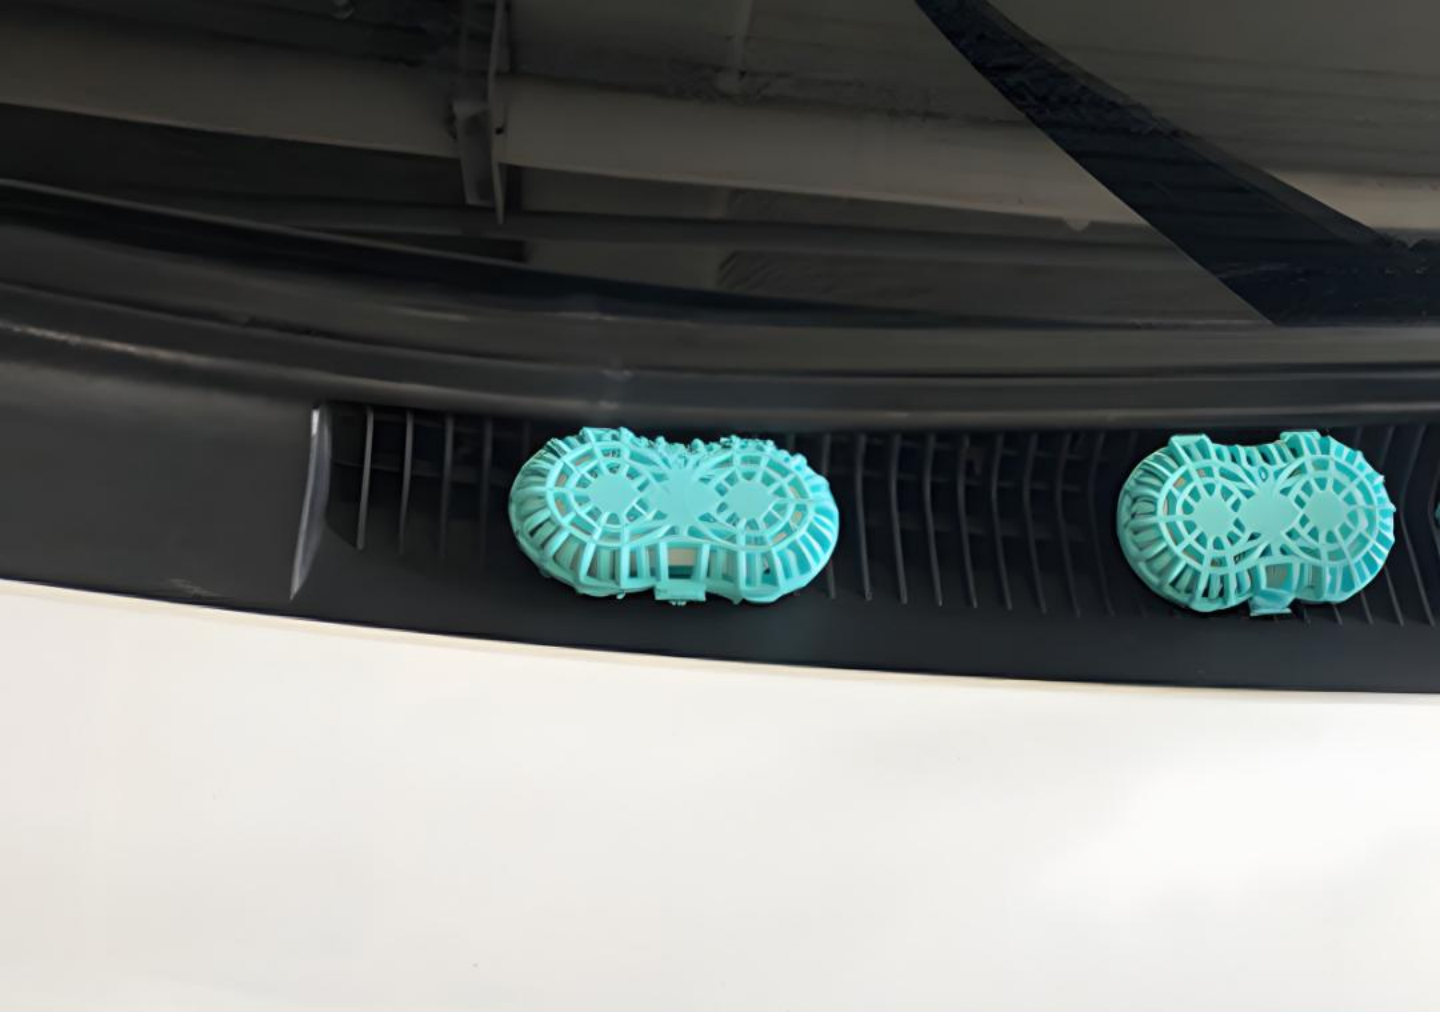

13 million tablets sold in Korea (Oct 2026)

SHOES

It starts in the lining.

Released slowly: an oil-infused disc inside the shoe removes isovaleric acid with plant-based essential oils, for about 2–3 months.

CAR

It starts at the air intake.

Released into the air path: the discs sit on the outside air intake for 20 minutes, then stay inside the car. Refillable.

One platform. Different places.

Developed and made by MASSCON in Korea.
